Serial No. 10/785,372
Filing Date: Feb. 24, 2004

In the Specification:

Please replace the Abstract of the Disclosure at page 62 with the following rewritten paragraph:

Abstract of the Disclosure

A method, apparatus and network device for controlling the flow of network data arranged in frames and minimizing congestion, ~~such as in the receive port of an HDLC controller~~ is disclosed. A status error indicator is generated within a receive FIFO memory indicative of a frame overflow within the receive FIFO memory. In response to the status error indicator, an early congestion interrupt is generated to a host processor indicative that a frame overflow has occurred within the receive FIFO memory. The incoming frame is discarded and the services of received frames are enhanced by one of either increasing the number of words of a direct memory access (DMA) unit burst size, or modifying the time-slice of other active processes.
